The BioRC Project Team and Support

USC Viterbi
School of Engineering

- Alice Parker, PI and Chongwu Zhou, Co-PI
- Graduate Assistants
  - Chih-Chieh Hsu - CNT circuits and simulation
  - Jonathan Joshi - CMOS circuits and simulation
  - Ko-Chung Tseng - Mathematical models of interconnectivity
  - Chuan Wang - Carbon nanotube fabrication
- Affiliated Students
  - Adi Azar - Neural architecture
  - Khushnood Irani - 3-D circuit visualization
  - Jason Mahvash - analog circuits
  - Numerous directed research students

- Support for this research has been provided by the Viterbi School of Engineering and the WiSE Program at USC and NSF Grant 0726815.

BioRC The Parker Group

Project Motivation: Challenges for a Synthetic Cortex

- Complexity:
  - Synaptic mechanisms - excitatory and inhibitory synapses
  - Dendritic computations and dendritic spikes
  - Quantum stochastic behavior of neurotransmitter release
- Scale:
  - 100 x 10^9 neurons
  - 10^4 to 10^5 synapses/neuron
  - ~100 transistors/synapse including dendritic computations
  - CMOS neurons for a cortex, absent interconnection area, could occupy an entire room, even in 2021
- Connectivity:
  - Fan-in/neuron 10^4 to 10^5 distinct connections
  - Fan-out 10^4
  - Address space 37 bits (assuming synaptic inputs are distinct)
- Plasticity:
  - New neural connections form within hours
  - Presynaptic depression/facilitation occur
  - Postsynaptic depression and potentiation occur

Meeting the Challenges for a Synthetic Cortex

- Complexity:
- **Exploit the analog computational power of transistor circuits**
- Scale:
- **Consider nanotechnological solutions - nanotubes, nanowires, graphene, quantum dots**
- Connectivity:

  3-D structure probably required
- Plasticity:
- **Add transistors as "knobs" to control neural behavior**
- **Self-assembly, using a protein gel to provide scaffolding, and synthetic DNA to assemble/reconfigure neural circuits**

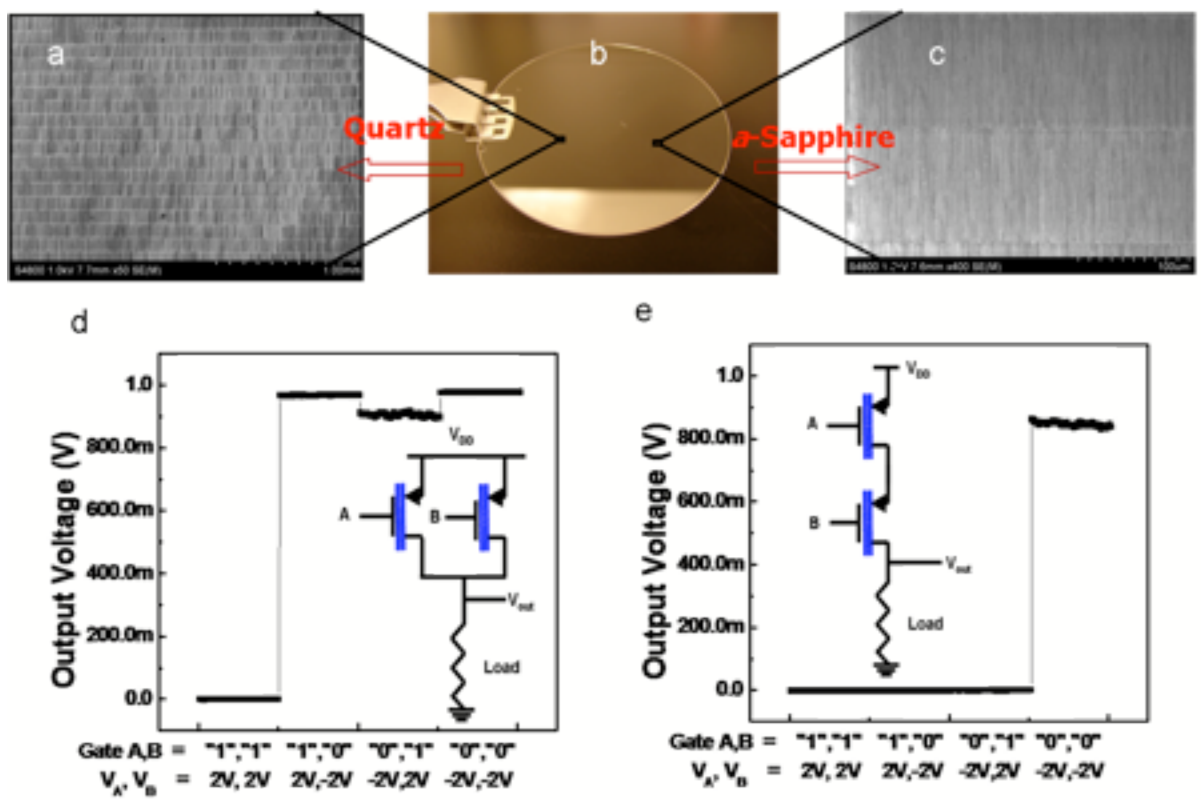
- **We are very far from a synthetic human cortex, but it may be possible in the coming decades**

BioRC
The Parker Group

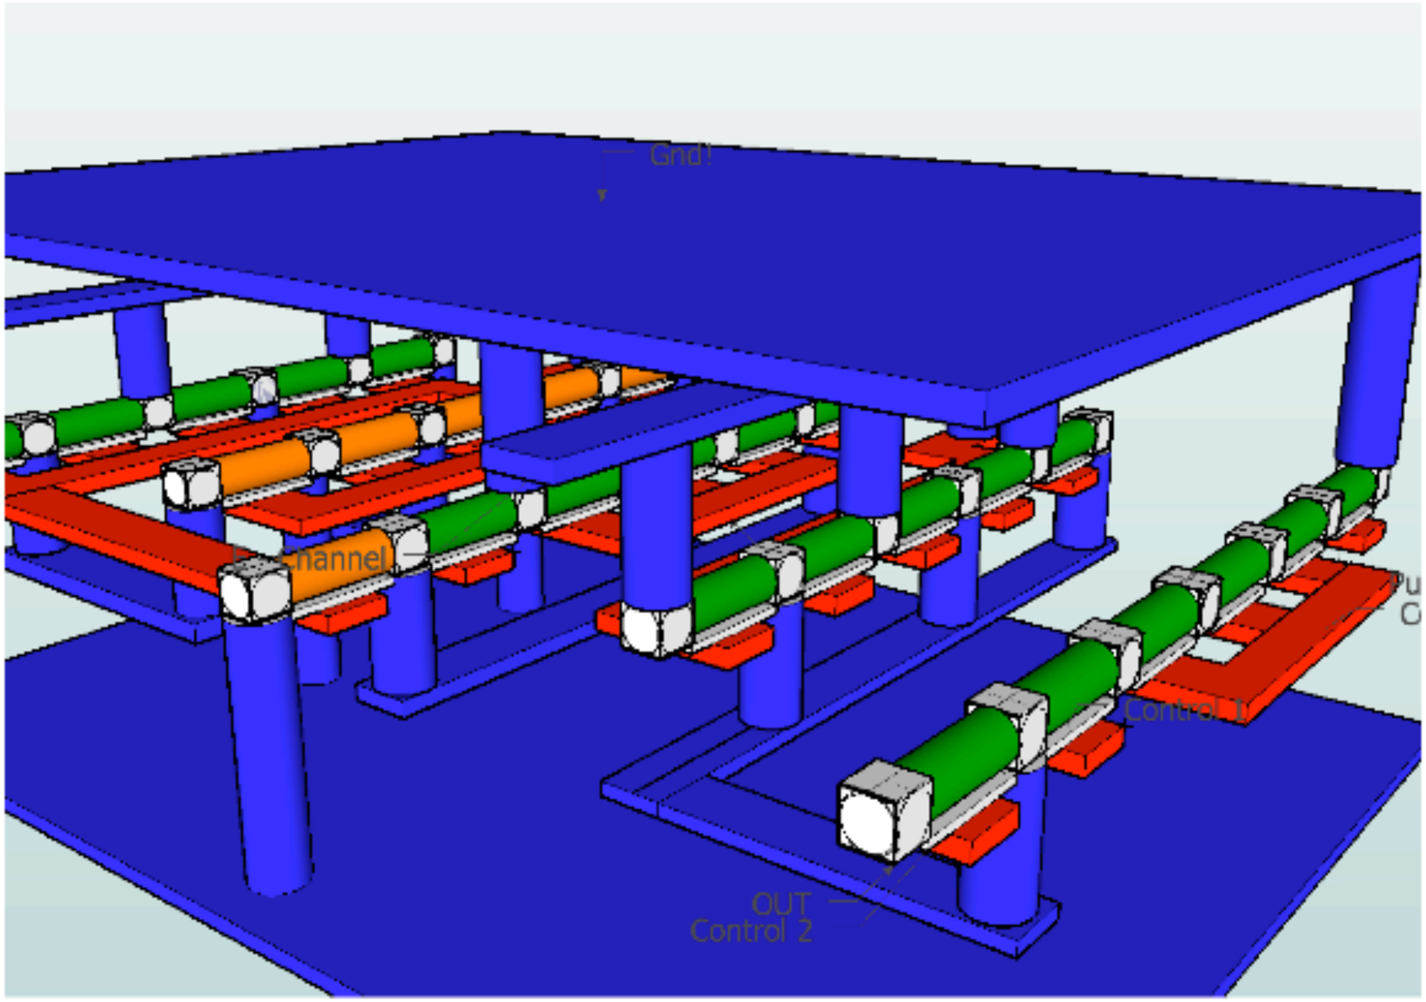
USC Viterbi School of Engineering

Results to Date

- **Carbon nanotube fabrication (Chongwu Zhou)**
  - **Aligned nanotubes, logic gates**



Artist's Conception of 3-D Carbon Nanotube Synapse



Biomimetic Neural Circuits

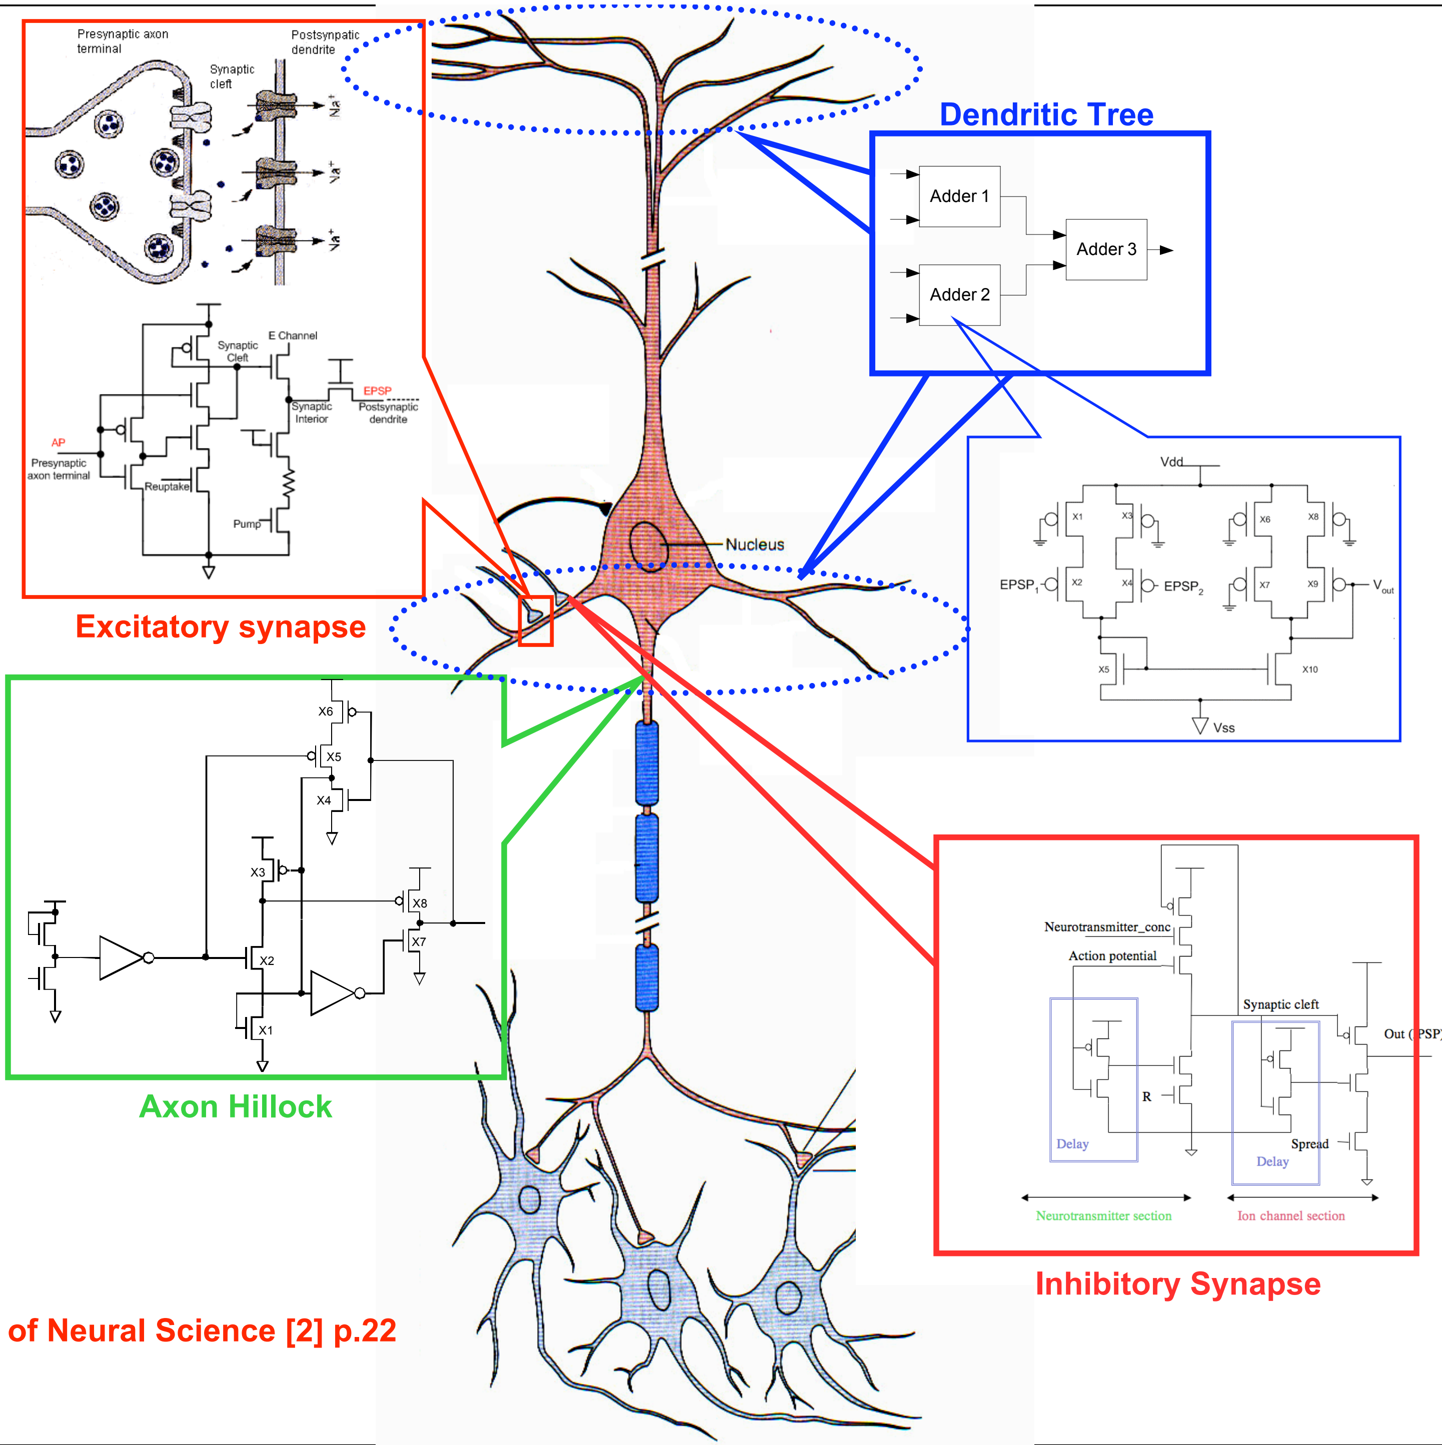


Figure from Principles of Neural Science [2] p.22

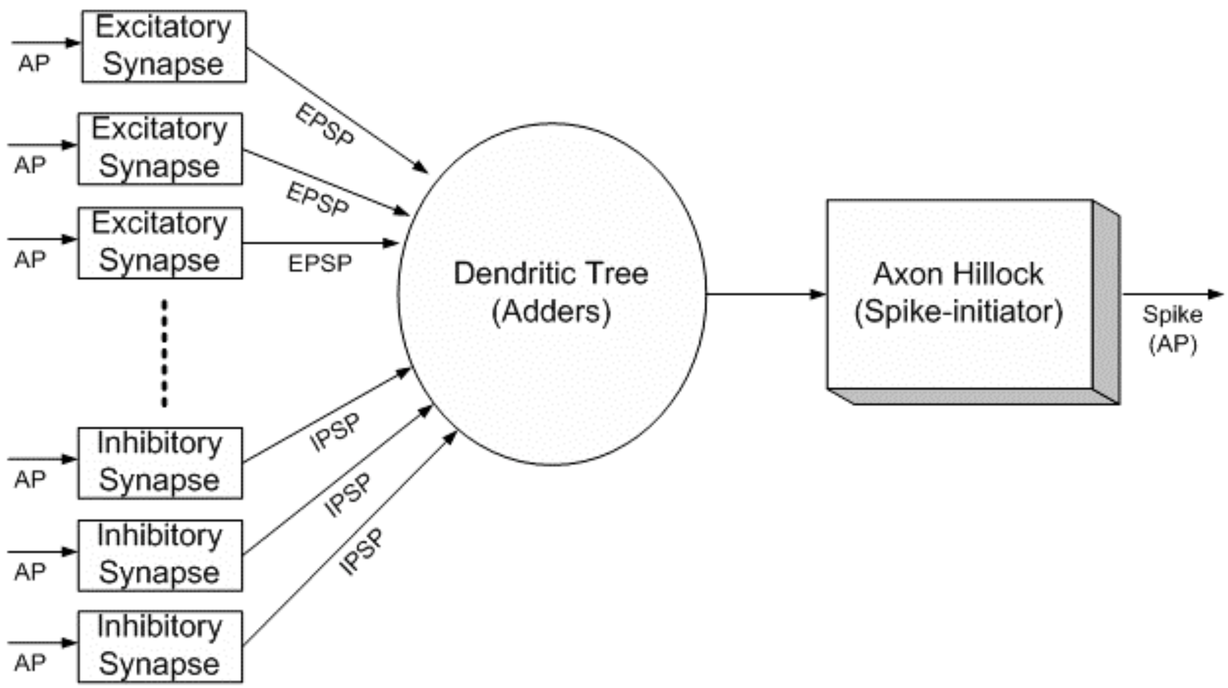
The whole neuron can be divided into these sub-circuits:

- Synapse
  - Excitatory/Inhibitory synapse circuit (Action Potential as inputs and EPSP/IPSP as outputs)
- Dendritic Tree
  - A pool of voltage adders (which can add two input stimuli in both linear or non-linear ways)
- Axon Hillock
  - Amplifier (in order to reach the threshold of carbon nanotube FET)
  - Spike-initiator (Action Potentials are all-or-none)



Results to Date: A Carbon Nanotube Synapse

IPSPs with varying amounts of released neurotransmitter

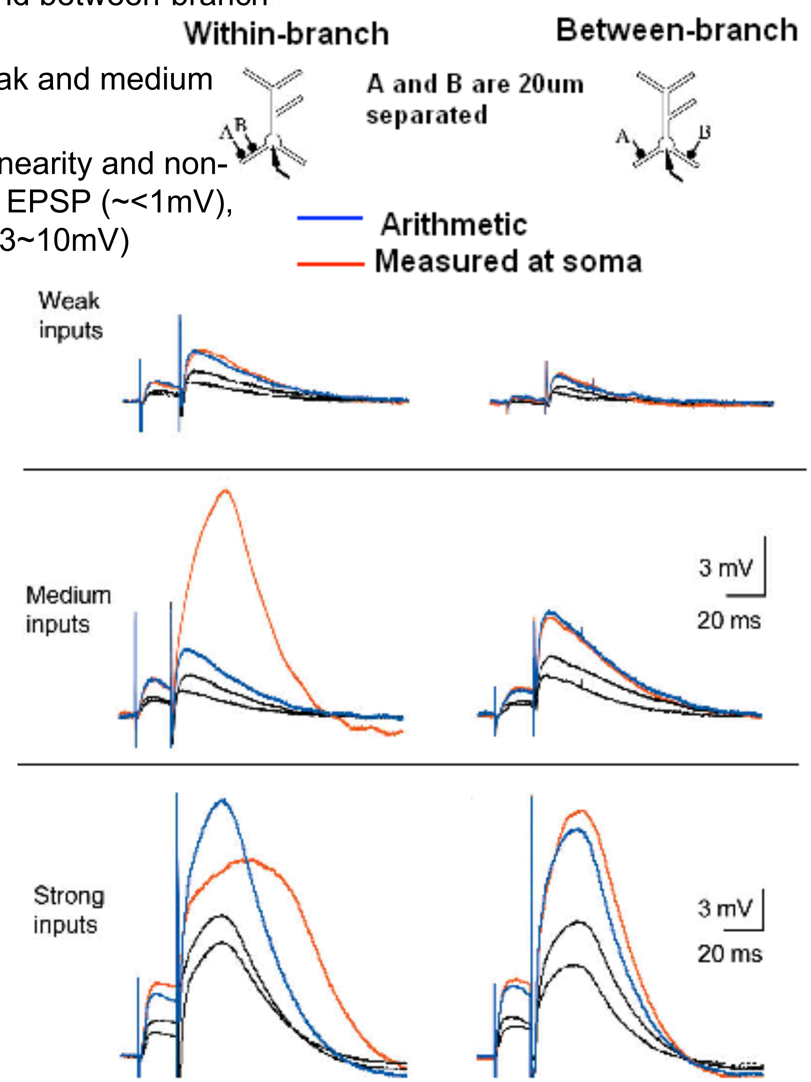
Dendritic Computations

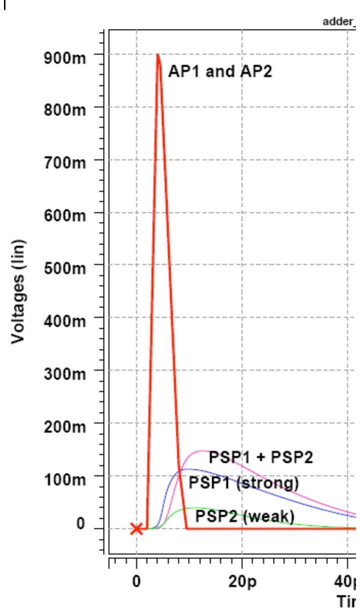
Linear or Non-linear summation

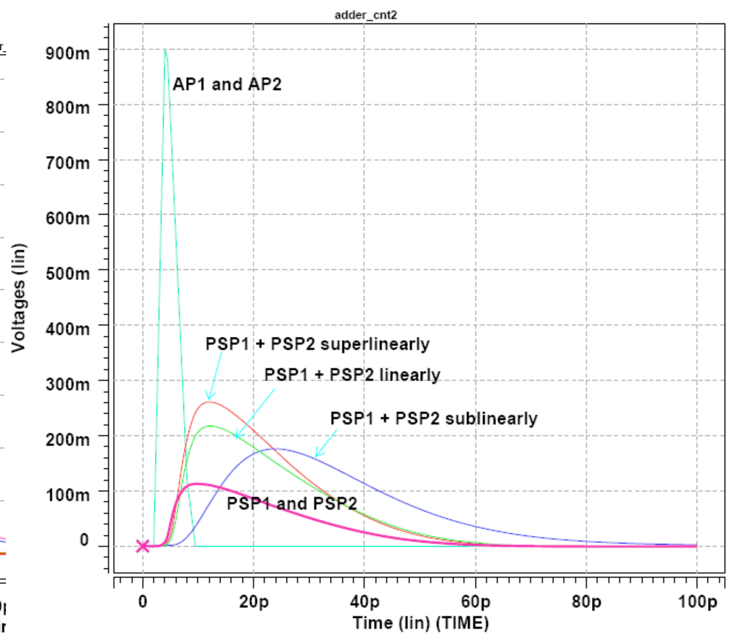
- Schiller et al. compared the measured and arithmetic results of EPSP summation at soma of layer-5 pyramidal neuron with respect to within-branch and between-branch stimulations
- It appears that between-branch EPSP summation is linear for weak and medium stimuli and slightly superlinear for strong stimuli.
- On the other hand, within-branch EPSP summation shows both linearity and non-linearity depending on the strength of EPSP. It was linear – weak EPSP (~<1mV), superlinear – medium EPSP (1~3mV), sublinear – strong EPSP (3~10mV)

Adder structure

- Adding two inputs linearly, sublinearly, and superlinearly





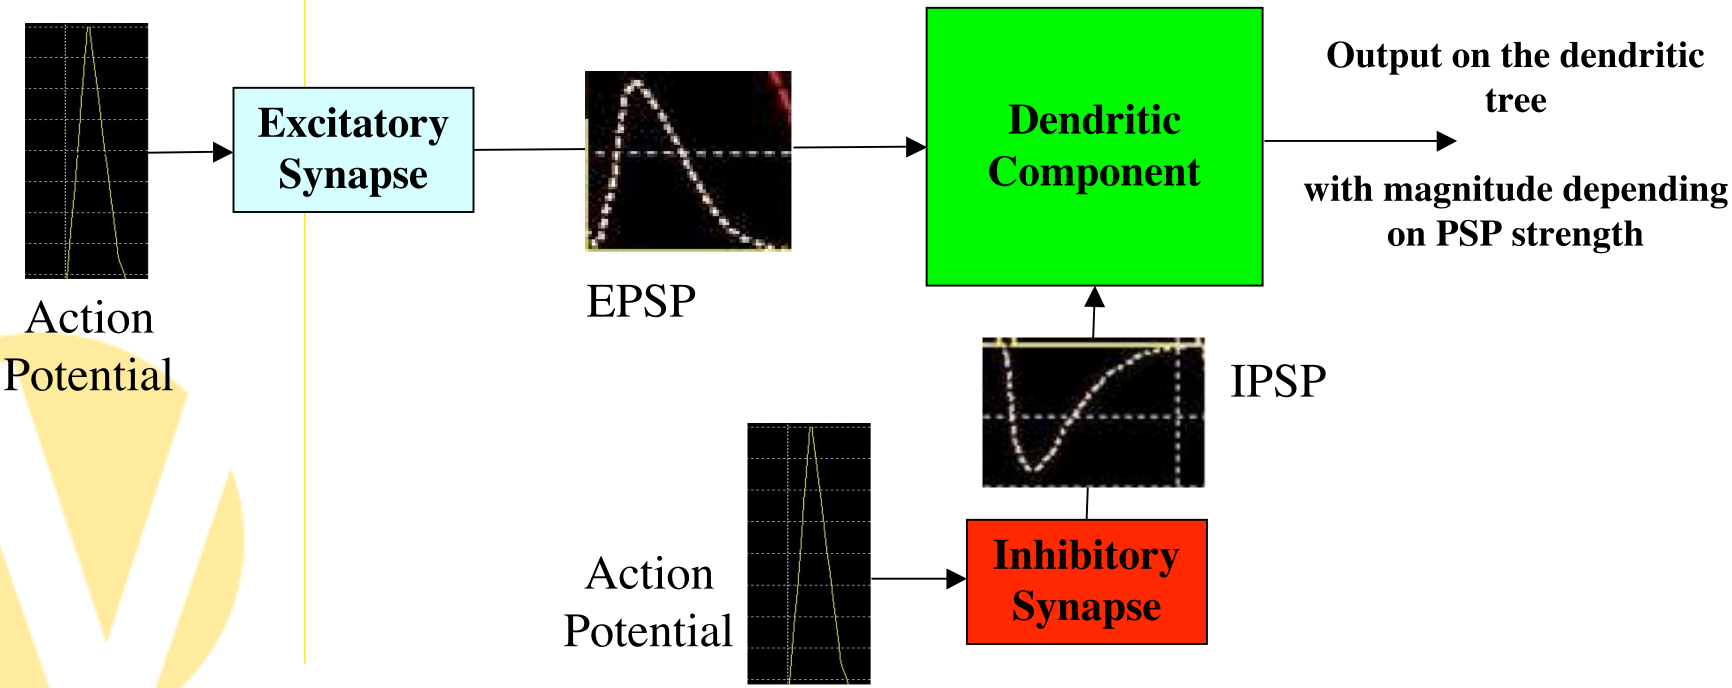


BioRC The Parker Group

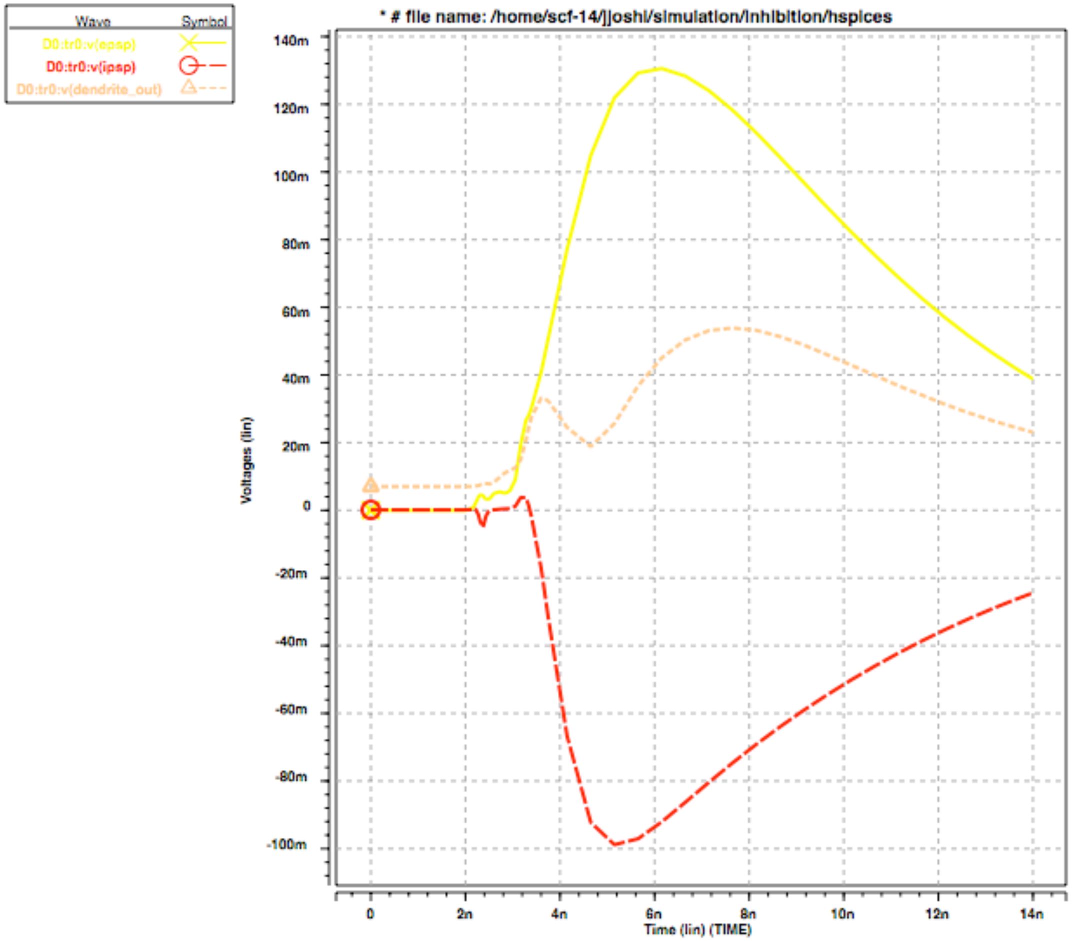
Dendritic Computations with Inhibition

USC Viterbi School of Engineering

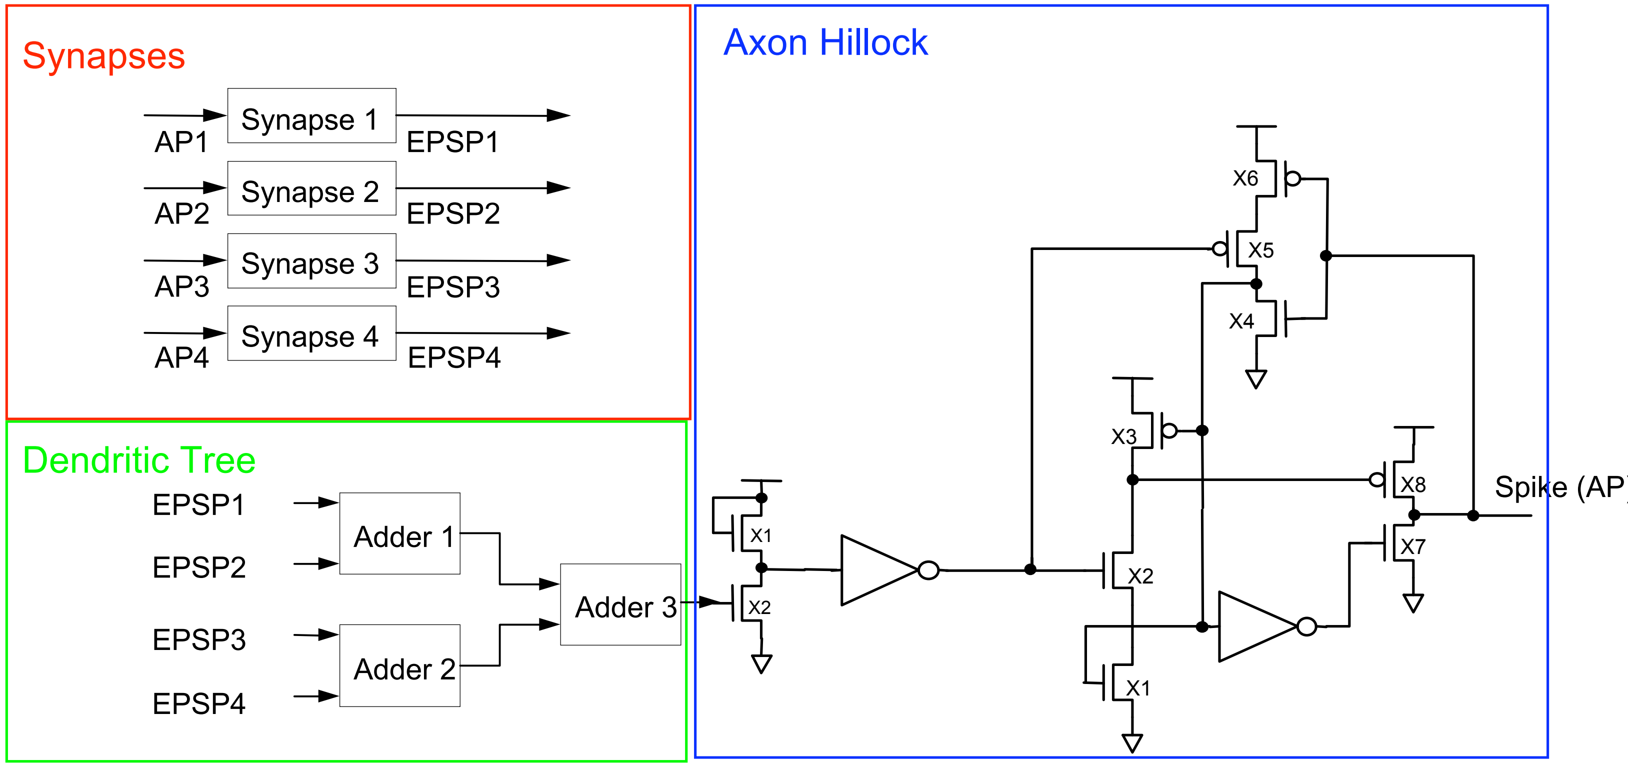
- Shunting Inhibition
  - Pulls the EPSP or the AP down to zero volts
- Hyperpolarizing Inhibition
  - More of a subtractive behavior



Dendritic Computations with Inhibition



Simplified Central Neuron Circuit



Red: Action Potential (artificial input to the pre-synaptic terminal)

Green: EPSP from the dendrites (post-synaptic sites) of the neuron

Blue: Action Potential spike (initiated at the axon hillock of the neuron)
